5-SUBSTITUTED-3-(1,2,3,6-TETRAHYDROPYRIDIN-4-YL)-
AND 3-(PIPERIDIN-4-YL)-1H-INDOLES:
NEW 5-HT_{1F} AGONISTS

5 Theories regarding the pathophysiology of migraine
have been dominated since 1938 by the work of Graham and
Wolff (*Arch. Neurol. Psychiatry*, 39, 737-63 (1938)). They
proposed that the cause of migraine headache was
vasodilatation of extracranial vessels. This view was
10 supported by knowledge that ergot alkaloids and
sumatriptan, a hydrophilic 5-HT₁ agonist which does not
cross the blood-brain barrier, contract cephalic vascular
smooth muscle and are effective in the treatment of
migraine. (Humphrey, et al., *Ann. NY Acad. Sci.*, 600,
15 587-600 (1990)). Recent work by Moskowitz has shown,
however, that the occurrence of migraine headaches is
independent of changes in vessel diameter (*Cephalalgia*,
12, 5-7, (1992)).

Moskowitz has proposed that currently unknown triggers
20 for pain stimulate trigeminal ganglia which innervate
vasculature within the cephalic tissue, giving rise to
release of vasoactive neuropeptides from axons on the
vasculature. These released neuropeptides then activate a
series of events, a consequence of which is pain. This
25 neurogenic inflammation is blocked by sumatriptan and ergot
alkaloids by mechanisms involving 5-HT receptors, believed
to be closely related to the 5-HT_{1D} subtype, located on the
trigeminovascular fibers (*Neurology*, 43(suppl. 3), S16-S20
(1993)).

30 Serotonin (5-HT) exhibits diverse physiological
activity mediated by at least seven receptor classes, the
most heterogeneous of which appears to be 5-HT₁. A human
gene which expresses one of these 5-HT₁ receptor subtypes,
named 5-HT_{1F}, was isolated by Kao and coworkers (*Proc.*
35 *Natl. Acad. Sci. USA*, 90, 408-412 (1993)). This 5-HT_{1F}
receptor exhibits a pharmacological profile distinct from
any serotonergic receptor yet described. The high affinity

-2-

of sumatriptan at this subtype, $K_i=23$ nM, suggests a role of the 5-HT_{1F} receptor in migraine.

This invention provides novel 5-HT_{1F} agonists which inhibit peptide extravasation due to stimulation of the trigeminal ganglia, and are therefore useful for the treatment of migraine and associated disorders.

The present invention provides novel 5-substituted-3-1,2,3,6-tetrahydropyridin-4-yl)-1H-indoles and 5-substituted-3-(piperidin-4-yl)-1H-indoles of Formula I:

I

in which

A-B is -CH-CH₂- or -C=CH-;

R is H or C₁-C₆ alkyl;

R¹ is H or C₁-C₄ alkyl;

X is -S-R², -C(O)R³, -C(O)NR⁴R¹⁵, -NR⁵R⁶, -NR⁷SO₂R⁸, -NHC(Q)NR¹⁰R¹¹, -NHC(O)OR¹² or -NR¹³C(O)R¹⁴;

where

Q is O, or S;

R² is phenyl, substituted phenyl, phenyl(C₁-C₄ alkylene), phenyl(C₁-C₄ alkylene) substituted in the phenyl ring, or pyridinyl;

R³ is C₁-C₆ alkyl, phenyl(C₁-C₄ alkylene), phenyl(C₁-C₄ alkylene) substituted in the phenyl ring, naphthyl, N-methyl-N-methoxyamino, heteroaryl, substituted heteroaryl, heteroaryl(C₁-C₄ alkyl), or substituted heteroaryl(C₁-C₄ alkyl);

R⁴ is heteroaryl, substituted heteroaryl, heteroaryl(C₁-C₄ alkyl), or substituted heteroaryl(C₁-C₄ alkyl);

5 R⁴ and R¹⁵ taken together with the nitrogen atom form a pyrrolidine, piperidine, substituted piperidine, piperazine, 4-substituted piperazine, morpholine or thiomorpholine ring;

R⁵ and R⁶ are both trifluoromethanesulfonyl;

R⁷ is H or C₁-C₄ alkyl;

10 R⁸ is C₁-C₄ alkyl, phenyl, substituted phenyl, or di(C₁-C₄ alkyl)amino;

15 R¹⁰ and R¹¹ are independently selected from the group consisting of C₁-C₆ alkyl, C₃-C₆ alkenyl, C₃-C₈ cycloalkyl, phenyl, substituted phenyl, phenyl(C₁-C₄ alkylene), phenyl(C₁-C₄ alkylene) substituted in the phenyl ring, ((C₁-C₄ alkyl or C₁-C₄ alkoxy carbonyl substituted)C₁-C₄ alkyl)phenyl, C₁-C₄ alkyl α -substituted with C₁-C₄ alkoxy carbonyl; or

20 R¹⁰ and R¹¹ taken together with the nitrogen atom form a pyrrolidine, piperidine, piperazine, 4-substituted piperazine, morpholine or thiomorpholine ring;

R¹² is C₁-C₆ alkyl, C₃-C₆ alkenyl, phenyl, substituted phenyl, C₃-C₈ cycloalkyl, C₁-C₄ alkyl ω -substituted with C₁-C₄ alkoxy;

25 R¹³ is H or C₁-C₄ alkyl;

30 R¹⁴ is C₁-C₁₀ alkyl substituted with up to three substituents selected from the group consisting of hydroxy, C₁-C₄ alkoxy, halo, aryloxy, C₁-C₄ alkoxy carbonyl and heteroaryloxy, C₂-C₁₀ alkenyl, C₂-C₁₀ alkynyl, C₃-C₈ cycloalkyl, phenyl, substituted phenyl, naphthyl, phenyl(C₁-C₄ alkylene), phenyl(C₁-C₄ alkylene) substituted on the phenyl ring, 2-phenylethylen-1-yl, diphenylmethyl, benzofused C₄-C₈ cycloalkyl, C₁-C₄ alkylene ω -substituted with C₃-C₆ cycloalkyl, or a heterocycle;

35 R¹⁵ is H or C₁-C₆ alkyl;

-4-

subject to the proviso that when R⁷ is H, R⁸ is not C₁-C₄ alkyl; and pharmaceutically acceptable acid addition salts and solvates thereof. This invention also provides a pharmaceutical formulation which comprises, in association
5 with a pharmaceutically acceptable carrier, diluent or excipient, a compound of Formula I.

A further embodiment of this invention is a method for increasing activation of the 5-HT_{1F} receptor for treating a variety of disorders which have been linked to decreased
10 neurotransmission of serotonin in mammals. Included among these disorders are depression, migraine pain, bulimia, premenstrual syndrome or late luteal phase syndrome, alcoholism, tobacco abuse, panic disorder, anxiety, general pain, post-traumatic syndrome, memory loss, dementia of
15 aging, social phobia, attention deficit hyperactivity disorder, disruptive behavior disorders, impulse control disorders, borderline personality disorder, obsessive compulsive disorder, chronic fatigue syndrome, premature ejaculation, erectile difficulty, anorexia nervosa,
20 disorders of sleep, autism, mutism, trichotillomania, trigeminal neuralgia, dental pain or temporomandibular joint dysfunction pain. The compounds of this invention are also useful as a prophylactic treatment for migraine. Any of these methods employ a compound of Formula I.

25 The use of a compound of Formula I for the activation of the 5-HT_{1F} receptor, for the inhibition of peptide extravasation in general or due to stimulation of the trigeminal ganglia specifically, and for the treatment of any of the disorders described supra, are all embodiments
30 of the present invention.

The general chemical terms used in the formulae above have their usual meanings. For example, the terms "alkyl, alkoxy and alkylthio" include such groups as methyl, ethyl, n-propyl, isopropyl, n-butyl, isobutyl, sec-butyl, tert-
35 butyl, pentyl, 2-pentyl-, 3-pentyl-, neopentyl, hexyl, heptyl, octyl and the like. The term "alkenyl" includes

vinyl, allyl, 1-buten-4-yl, 2-buten-4-yl, 1-penten-5-yl, 2-penten-5-yl, 3-penten-5-yl, 1-hexen-6-yl, 2-hexen-6-yl, 3-hexen-6-yl, 4-hexen-6-yl and the like. The term "alkynyl" includes acetylenyl, propynyl, 2-butyn-4-yl, 1-butyn-4-yl, 1-pentyn-5-yl, 2-pentyn-5-yl and the like. The term "acyl" includes, for example, formyl, acetyl, propanoyl, butanoyl, and 2-methylpropanoyl. The term "cycloalkyl" includes such groups as cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl and cyclooctyl. The term "phenyl(C₁-C₄ alkylene)" includes such groups as benzyl, phenethyl, phenpropyl and phenbutyl. The term "(C₁-C₄ alkyl)sulfonyl" includes methanesulfonyl, ethanesulfonyl, propanesulfonyl, isopropanesulfonyl, butanesulfonyl and the like. The term "halo" includes fluoro, chloro, bromo and iodo.

The term "substituted phenyl" or "phenyl(C₁-C₄ alkylene) substituted in the phenyl ring" is taken to mean the phenyl moiety may be substituted with one substituent selected from the group consisting of halo, C₁-C₄ alkyl, C₁-C₈ alkoxy, C₁-C₄ alkylthio, nitro, cyano, di(C₁-C₄ alkyl)amino, trifluoromethyl, trifluoromethoxy, phenyl, C₁-C₄ acyl, benzoyl or (C₁-C₄ alkyl)sulfonyl, or two to three substituents independently selected from the group consisting of halo, nitro, C₁-C₄ alkyl, or C₁-C₄ alkoxy.

The term "heterocycle" is taken to mean stable aromatic and non-aromatic 5- and 6-membered rings containing from 1 to 3 heteroatoms selected from the group consisting of nitrogen, oxygen and sulfur, said rings being optionally benzofused. All of these rings may be substituted with up to three substituents independently selected from the group consisting of halo, C₁-C₄ alkoxy, C₁-C₄ alkyl, cyano, nitro, hydroxy, -S(O)_n-(C₁-C₄ alkyl) and -S(O)_n-phenyl where n is 0, 1 or 2. Non-aromatic rings include, for example, pyrrolidinyl, piperidinyl, piperazinyl, tetrahydrofuryl, oxazolidinyl, dioxanyl, pyranyl, and the like. Benzofused non-aromatic rings include indolinyl, 1,2,3,4-tetrahydroquinolinyl, 1,2,3,4-tetrahydroisoquinolinyl and the like. Aromatic rings

include furyl, thienyl, pyridinyl, pyrrolyl, N-methylpyrrolyl, oxazolyl, isoxazolyl, pyrazolyl, imidazolyl, triazolyl, oxadiazolyl, thiadiazolyl, thiazolyl, pyrimidinyl, pyrazinyl, pyridazinyl, and the like. Benzofused aromatic rings include isoquinolinyl, benzoxazolyl, benzthiazolyl, quinolinyl, benzofuranyl, thionaphthyl, indolyl and the like.

The term "heteroaryl" is taken to mean an aromatic or benzofused aromatic heterocycle as defined in the previous paragraph. The term "substituted heteroaryl" is taken to mean an aromatic or benzofused aromatic heterocycle as defined in the previous paragraph substituted with up to three substituents independently selected from the group consisting of halo, C₁-C₄ alkoxy, C₁-C₄ alkyl, cyano, nitro, hydroxy, -S(O)_n-(C₁-C₄ alkyl) and -S(O)_n-phenyl where n is 0, 1 or 2. The term "heteroaryl(C₁-C₄ alkyl)" is taken to mean a branched or linear alkyl chain of 1 to 4 carbon atoms substituted at some point with an aromatic or benzofused aromatic heterocycle moiety. The term "substituted heteroaryl(C₁-C₄ alkyl)" is taken to mean a branched or linear alkyl chain of 1 to 4 carbon atoms substituted at some point with an aromatic or benzofused aromatic heterocycle moiety which is substituted with up to three substituents independently selected from the group consisting of halo, C₁-C₄ alkoxy, C₁-C₄ alkyl, cyano, nitro, hydroxy, -S(O)_n-(C₁-C₄ alkyl) and -S(O)_n-phenyl where n is 0, 1 or 2.

The term "heteroaryloxy" is taken to mean a heteroaryl or substituted heteroaryl group, as defined in the previous paragraph, bonded to an oxygen atom.

The term "aryloxy" is taken to mean a phenyl or substituted phenyl group bonded to an oxygen atom.

The term "4-substituted piperazine" is taken to mean a piperazine ring substituted at the 4-position with a substituent selected from the group consisting of C₁-C₆ alkyl, C₁-C₄ alkoxy substituted C₁-C₆ alkyl, phenyl, substituted phenyl, phenyl(C₁-C₄ alkylene), phenyl(C₁-C₄

alkylene) substituted in the phenyl ring, heteroaryl, and heteroaryl(C₁-C₄ alkylene).

5 The term "substituted piperidine" is taken to mean a piperidine ring optionally substituted with a substituent selected from the group consisting of hydroxy, hydroxymethyl, and N,N-di(C₁-C₄ alkyl)carboxamido.

10 The term "benzofused C₄-C₈ cycloalkyl" is taken to mean a C₄-C₈ cycloalkyl group fused to a phenyl ring. Examples of these groups include benzocyclobutyl, indanyl, 1,2,3,4-tetrahydronaphthyl, and the like.

While all of the compounds of this invention are useful as 5-HT_{1F} agonists, certain classes are preferred. The following paragraphs describe such preferred classes.

30 The compounds of this invention are useful in a method for increasing activation of the 5-HT_{1F} receptor for treating a variety of disorders which have been linked to decreased neurotransmission of serotonin in mammals. It is preferred that the mammal to be treated by the administration of compounds of this invention is human.

35 Since the compounds of this invention are amines, they are basic in nature and accordingly react with any of a

-12-

number of inorganic and organic acids to form pharmaceutically acceptable acid addition salts. Since some of the free amines of the compounds of this invention are typically oils at room temperature, it is preferable to convert the free amines to their pharmaceutically acceptable acid addition salts for ease of handling and administration, since the latter are routinely solid at room temperature. Acids commonly employed to form such salts are inorganic acids such as hydrochloric acid, hydrobromic acid, hydroiodic acid, sulfuric acid, phosphoric acid, and the like, and organic acids, such as p-toluene-sulfonic acid, methanesulfonic acid, oxalic acid, p-bromo-phenylsulfonic acid, carbonic acid, succinic acid, citric acid, benzoic acid, acetic acid and the like. Examples of such pharmaceutically acceptable salts thus are the sulfate, pyrosulfate, bisulfate, sulfite, bisulfite, phosphate, mono-hydrogenphosphate, dihydrogenphosphate, metaphosphate, pyrophosphate, chloride, bromide, iodide, acetate, propion-ate, decanoate, caprylate, acrylate, formate, isobutyrate, caproate, heptanoate, propiolate, oxalate, malonate, suc-cinate, suberate, sebacate, fumarate, maleate, butyne-1,4-dioate, hexyne-1,6-dioate, benzoate, chlorobenzoate, methyl-benzoate, dinitrobenzoate, hydroxybenzoate, methoxybenzoate, phthalate, sulfonate, xylenesulfonate, phenylacetate, phenylpropionate, phenylbutyrate, citrate, lactate, b-hydroxybutyrate, glycollate, tartrate, methanesulfonate, propanesulfonate, naphthalene-1-sulfonate, naphthalene-2-sulfonate, mandelate and the like. Preferred pharmaceutically acceptable salts are those formed with hydrochloric acid, oxalic acid or fumaric acid.

The following group is illustrative of compounds contemplated within the scope of this invention:

5-(4-fluorophenyl)thio-3-(1,2,3,6-tetrahydropyridin-4-yl)-1H-indole

5-(3-chlorophenyl)thio-3-(1-(pent-2-yl)-1,2,3,6-tetrahydropyridin-4-yl)-2-methyl-1H-indole

15 The compounds of this invention are prepared by methods well known to one of ordinary skill in the art, such as that generally described in U.S. #4,443,451, hereby incorporated by reference. While the simple indoles required for the preparation of the compounds of this invention are generally commercially available, their
20 preparations are described in Robinson, *The Fischer Indole Synthesis*, Wiley, New York (1983); Hamel, et al., *Journal of Organic Chemistry*, 59, 6372 (1994); and Russell, et al., *Organic Preparations and Procedures International*, 17, 391 (1985).

25 The compounds of the invention where X is $-NR^7SO_2R^8$ may be prepared by first modifying an appropriate 5-aminoindole. When R^7 is hydrogen, the 5-aminoindole is reacted with an appropriate sulfonyl halide or anhydride to give the corresponding sulfonamide. When R^7 is lower
30 alkyl, however, the 5-aminoindole is first acylated, and then reduced with an appropriate hydride reducing agent. Alternatively, the 5-aminoindole may be reductively alkylated with an appropriate aldehyde or ketone in the presence of a suitable hydride reducing agent to give the
35 appropriately substituted indole. These substituted indoles are then reacted with a sulfonyl halide or anhydride to give the corresponding sulfonamide. This

chemistry is illustrated in Synthetic Scheme I, where M is methoxy, ethoxy, methyl, ethyl, propyl, or isopropyl, LG is chloro or bromo, and R^1 , R^7 , and R^8 are as defined *supra*.

Synthetic Scheme I

$R^Z = H$

$R^Z = \text{lower alkyl}$

When R^7 is to be hydrogen, a solution of 5-aminoindole in a suitable solvent, such as tetrahydrofuran, dioxane, diethyl ether or dimethylformamide, at a temperature from about ambient to about 0°C , is reacted with a commercially available R^8 -sulfonyl halide or R^8 -sulfonic anhydride in the presence of a suitable base such as pyridine or triethylamine. The resultant sulfonamide may be isolated by dilution of the reaction mixture with water, adjustment of pH, and extraction with a water immiscible solvent such as dichloromethane. The product may be used for further reaction as recovered, or may be purified by chromatography, or by recrystallization from a suitable solvent.

When R^7 is to be lower alkyl, a solution of 5-aminoindole in a suitable solvent, such as tetrahydrofuran, dioxane, or diethyl ether, at a temperature from about ambient to about 0°C , is reacted with a compound of structure $\text{M}-\text{C}(\text{O})-\text{halo}$ in the presence of a suitable base such as pyridine or triethylamine. The resultant compound is isolated by dilution of the reaction mixture with water and extraction with a water immiscible solvent such as dichloromethane. This acylated product may either be purified chromatographically or used directly in the subsequent step. The acylated product is then dissolved in a suitable solvent, such as tetrahydrofuran or diethyl ether, at a temperature from about ambient to about 0°C , and is treated with a suitable hydride reducing agent such as diborane or lithium aluminum hydride. The reaction is stirred from 1 to 24 hours and is then treated with aqueous solution of sodium sulfate. The resultant suspension is filtered, and the filtrate concentrated under reduced pressure. The product may be used for further reaction as is, purified by chromatography, or recrystallized from a suitable solvent.

Alternatively, a solution of a 5-aminoindole in a solvent suitable for the azeotropic removal of water, such

-50-

as toluene, benzene or cyclohexane, is reacted at reflux with an appropriate aldehyde or ketone, such as formaldehyde, acetaldehyde, propanal, butanal or acetone, in the presence of 0.1-10% of a proton source such as *p*-toluenesulfonic acid. When the reaction is complete the volatiles are removed under reduced pressure and the residue redissolved in an alkanol such as methanol or ethanol. This solution is then subjected to hydrogenation conditions, or is treated with an appropriate hydride reducing agent, such as sodium borohydride or, preferably, sodium cyanoborohydride in the presence of an anhydrous acid such as hydrogen chloride. The reaction is then diluted with water, treated with base and extracted into a water immiscible solvent such as dichloromethane. The product may be used as is for further reaction, purified by chromatography or crystallized from a suitable solvent. This product is now treated with a commercially available R^8 -sulfonyl halide or R^8 -sulfonic anhydride as described *supra* to give the required sulfonamides.

Compounds of the invention where X is $-S-R^2$, $-C(O)R^3$ or $-C(O)NR^4R^{15}$ are prepared by first converting a 5-bromoindole into a 5-bromo-3-(1,2,3,6-tetrahydropyridin-4-yl)-1H-indole or 5-bromo-3-(1-piperidin-4-yl)-1H-indole. Compounds of the invention where X is $-NR^5R^6$, $-NHC(O)NR^{10}R^{11}$, $-NHC(O)OR^{12}$ or $-NR^{13}C(O)R^{14}$ are prepared by first converting a 5-nitro- or 5-aminoindole into a 5-nitro- or 5-amino-3-(1,2,3,6-tetrahydropyridin-4-yl)-1H-indole or into the corresponding 5-nitro- or 5-amino-(1-piperidin-4-yl)-1H-indole. Compounds of the invention where X is $-NR^7SO_2R^8$ or $-NR^{13}C(O)R^{14}$ may be prepared by converting the appropriately substituted indole into the corresponding 3-(1,2,3,6-tetrahydropyridin-4-yl)-1H-indole or 3-(1-piperidin-4-yl)-1H-indole. This chemistry is illustrated in Synthetic Scheme II, where Y is nitro, amino, bromo, $-NR^{13}C(O)R^{14}$, or $-NR^7SO_2R^8$, and R, R^1 , R^7 , R^8 , R^{13} and R^{14} are as defined *supra*.

Synthetic Scheme II

- 5 The 5-substituted indole is condensed with a 4-
piperidone in the presence of a suitable base to give the
corresponding 5-substituted-3-(1,2,3,6-tetrahydropyridin-4-
yl)-1H-indole. The reaction is performed by first
10 dissolving an excess of the base, typically sodium or
potassium hydroxide, in a lower alkanol, typically methanol
or ethanol. The indole and two equivalents of the 4-
piperidone are then added and the reaction refluxed for 8-
72 hours. The resulting 5-substituted-3-(1,2,3,6-
tetrahydro-pyridin-4-yl)-1H-indoles may be isolated from
15 the reaction mixture by the addition of water. Compounds
which precipitate may be isolated directly by filtration

-52-

while others may be extracted by adjusting the pH of the solution and extracting with a water immiscible solvent such as ethyl acetate or dichloromethane. The compounds recovered may be used directly in subsequent steps or first
5 purified by silica gel chromatography or recrystallization from a suitable solvent.

The 5-substituted-3-(1-substituted-1,2,3,6-tetrahydro-pyridin-4-yl)-1H-indoles may be used to prepare other compounds of the invention or, if desired, may be
10 hydrogenated over a precious metal catalyst, such as palladium on carbon, to give the corresponding 5-substituted-3-(piperidin-4-yl)-1H-indoles. When Y is bromo, a hydrogenation catalyst such as sulfided platinum on carbon, platinum oxide, or a mixed catalyst system of
15 sulfided platinum on carbon with platinum oxide is used to prevent hydrogenolysis of the 5-bromo substituent during reduction of the tetrahydro-pyridinyl double bond. The hydrogenation solvent may consist of a lower alkanol, such as methanol or ethanol, tetrahydrofuran, or a mixed solvent
20 system of tetrahydrofuran and ethyl acetate. The hydrogenation may be performed at an initial hydrogen pressure of 20-80 p.s.i., preferably from 50-60 p.s.i., at 0-60°C, preferably at ambient temperature to 40°C, for 1 hour to 3 days. Additional charges of hydrogen may be
25 required to drive the reaction to completion depending on the specific substrate. The 5-substituted-3-(piperidin-4-yl)-1H-indoles prepared in this manner are isolated by removal of the catalyst by filtration followed by concentration of the reaction solvent under reduced
30 pressure. The product recovered may be used directly in a subsequent step or further purified by chromatography, or by recrystallization from a suitable solvent.

As an alternative to hydrogenation, the 5-substituted-3-(1,2,3,6-tetrahydro-4-pyridinyl)-1H-indoles may be
35 converted to the corresponding 5-substituted-3-(piperidin-4-yl)-1H-indoles by treatment with trifluoroacetic acid/triethylsilane if desired. The 5-substituted-3-(1-

-53-

substituted-1,2,5,6-tetrahydro-4-pyridinyl)-1H-indole is dissolved in trifluoroacetic acid to which is added an excess, 1.1-10.0 equivalents, of triethylsilane. The reaction mixture is stirred at about ambient temperature for from about 1 to about 48 hours at which time the reaction mixture is concentrated under reduced pressure. The residue is then treated with 2N sodium or potassium hydroxide and the mixture extracted with a water immiscible solvent such as dichloromethane or diethyl ether. The resultant 5-substituted-3-(piperidin-4-yl)-1H-indole is purified by column chromatography if desired.

The skilled artisan will appreciate that the 5-nitro substituent may be reduced before or after condensation with an appropriate 4-piperidone. Additionally, the nitro group and the 1,2,3,6-tetrahydropyridinyl double bond may be hydrogenated simultaneously if desired.

The compounds of the invention where X is $-S-R^2$ are prepared from the corresponding 5-bromo-3-(1,2,3,6-tetrahydropyridin-4-yl)-1H-indoles or 5-bromo-3-(piperidin-4-yl)-1H-indoles as illustrated in Synthetic Scheme III, where A, B, R^1 and R^2 are as defined *supra* and R = C₁-C₄ alkyl.

Synthetic Scheme III

-54-

The 5-bromo-3-(1,2,3,6-tetrahydropyridin-4-yl)-1H-indoles or 5-bromo-3-(piperidin-4-yl)-1H-indoles in a suitable aprotic solvent, such as diethyl ether or tetrahydrofuran, are cooled to about 0°C and treated with potassium hydride to deprotonate the indole nucleus at the 1-position. While other hydrides are useful for this deprotonation, the resultant potassium salt is more soluble in typical reaction solvents. The reaction mixture is then cooled to about -78°C and halogen-metal exchange effected by the addition of two equivalents of t-butyllithium. To this dianion solution are then added an appropriate disulfide and the reaction mixture allowed to warm to ambient temperature. The compound of the invention is isolated by treating the reaction mixture with aqueous base, such as sodium or potassium hydroxide, and then extracting with a water immisible solvent such as diethyl ether or dichloromethane. The reaction product may then be purified by column chromatography.

Compounds of the invention where X is -C(O)R³ or -C(O)NR⁴R¹⁵ are prepared from the corresponding 5-bromo-3-(1,2,3,6-tetrahydropyridin-4-yl)-1H-indoles or 5-bromo-3-(piperidin-4-yl)-1H-indoles as illustrated in Synthetic Scheme IV, where A, B, R¹, R³, R⁴ and R¹⁵ are as defined supra and R = C₁-C₄ alkyl.

The dianion of the 5-bromo-3-(1,2,3,6-tetrahydropyridin-4-yl)-1H-indoles or 5-bromo-3-(1-substituted-piperidin-4-yl)-1H-indole, prepared as described *supra*, is then treated with N,N'-dimethyl-N,N'-dimethoxyurea. The resulting N-methyl-N-methoxy-5-carboxamido-1H-indole is isolated by treating the reaction mixture with aqueous base, such as sodium or potassium hydroxide, and then extracting with a water immiscible solvent such as diethyl ether or dichloromethane. The reaction product may then be purified by column chromatography.

10

15

Compounds of the invention where X is $-C(O)R^3$ are prepared by reacting a solution of the N-methyl-N-methoxy-5-carboxamido-3-(1,2,3,6-tetrahydropyridin-4-yl)-1H-indole or N-methyl-N-methoxy-5-carboxamido-3-(piperidin-4-yl)-1H-indole in a suitable solvent, such as diethyl ether or tetrahydrofuran, at about 0°C, with an appropriate reagent such as an aryl- or alkyl lithium or an alkyl or aryl Grignard reagent. These reagents are either commercially available or may be prepared by methods well known to one of ordinary skill in the art. The aryl- or alkyl lithium reagents are conveniently prepared by treating an appropriate aryl or alkyl halide with n-butyllithium. The aryl or alkyl Grignard reagents may be prepared by treating an appropriate aryl or alkyl halide with magnesium. The compounds of interest may be isolated by aqueous work-up followed by extraction into a water immiscible solvent such as diethyl ether or dichloromethane, and then purified by chromatography, or by recrystallization from a suitable solvent.

The skilled artisan will also appreciate that the compounds of the invention where X is $-C(O)R^3$ are also available by the reaction of the dianion of either a 5-bromo-3-(1,2,3,6-tetrahydropyridin-4-yl)-1H-indole or a 5-bromo-3-(piperidin-4-yl)-1H-indole with an appropriate aryl or alkyl N-methyl-N-methoxycarboxamide. These carboxamides are prepared from the corresponding carboxylic acids and N-methyl-N-methoxyamine under standard peptide coupling conditions using N,N'-dicyclohexylcarbodiimide.

Compounds of the invention where X is $-C(O)NR^4R^{15}$ are prepared by reacting a solution of the N-methyl-N-methoxy-5-carboxamido-3-(1,2,3,6-tetrahydropyridin-4-yl)-1H-indole or N-methyl-N-methoxy-5-carboxamido-3-(piperidin-4-yl)-1H-indole in a suitable solvent, such as diethyl ether or tetrahydrofuran, at about 0°C, with the anion of an appropriate amine. These anions are prepared by treating the appropriate amine with n-butyllithium. The compounds

-57-

of interest may be isolated by aqueous work-up followed by extraction into a water immiscible solvent such as diethyl ether or dichloromethane, and then purified by chromatography, or by recrystallization from a suitable solvent.

5 Alternatively, compounds of the invention where X is $-C(O)NR^4R^{15}$ are prepared by subjecting an appropriate indole 5-carboxylic acid and an appropriate amine to standard peptide coupling conditions. The indole 5-carboxylic acid in an appropriate solvent may be treated
10 with oxalyl chloride, thionyl chloride or phosphorous tribromide in an appropriate solvent, for example toluene, to prepare the corresponding acid halide. The acid halide in a suitable solvent, for example tetrahydrofuran or dimethylformamide, may be treated with an amine of formula
15 HNR^4R^{14} in the presence of a suitable base such as triethylamine, pyridine or dimethylaminopyridine to provide the desired compound. The product may be isolated by aqueous work-up followed by extraction into a water
20 immiscible solvent such as diethyl ether, ethyl acetate or dichloromethane, and then purified by chromatography, or by recrystallization from a suitable solvent.

 Preferably, compounds of the invention where X is $-C(O)NR^4R^{15}$ are prepared by reacting the appropriate indole 5-carboxylic acid with an appropriate amine in the presence
25 of typical peptide coupling reagents such as N,N'-carbonyldiimidazole (CDI), N,N'-dicyclohexylcarbodiimide (DCC) and 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (EDC).

 Compounds of the invention where X is $-NR^5R^6$,
30 $-NHC(Q)NR^{10}R^{11}$, $-NHC(O)OR^{12}$ or $-NR^{13}C(O)R^{14}$ are prepared by reacting the appropriate 5-amino-3-(1,2,3,6-tetrahydropyridin-4-yl)-1H-indole or 5-amino-3-(piperidin-4-yl)-1H-indole with a suitable electrophile. These
35 reactions are illustrated in Synthetic Scheme V, where A, B, R^1 , R^5 , R^6 , R^{10} , R^{11} , R^{12} , R^{13} and R^{14} are as described supra and R = C₁-C₄ alkyl.

-58-

Synthetic Scheme V

-59-

Compounds of the invention where X is $-NR^{5R6}$ are prepared by treating a solution of the 5-amino-3-(1,2,3,6-tetrahydropyridin-4-yl)-1H-indole or 5-amino-3-(piperidin-4-yl)-1H-indole in a suitable solvent, such as
5 dichloromethane, tetrahydrofuran, acetonitrile or dimethylformamide, with a suitable electrophile, such as trifluoromethanesulfonic anhydride or N-carbethoxyphthalimide, in the presence of a suitable base such as pyridine or triethylamine. The reaction product is
10 isolated by evaporation of the reaction solvent under reduced pressure. The product may be purified by chromatography, or by crystallization from an appropriate solvent.

Compounds of the invention where X is $-NHC(Q)NR^{10R11}$ are prepared by treating a solution of the 5-amino-3-(1,2,3,6-tetrahydropyridin-4-yl)-1H-indole or 5-amino-3-(piperidin-4-yl)-1H-indole in a suitable solvent, such as
15 chloroform or dichloromethane, with an appropriate isocyanate, isothiocyanate, carbamoyl chloride or carbamoyl bromide. Appropriate carbamoyl chlorides are available by
20 treating an amine of formula HNR^{10R11} with phosgene. When a carbamoyl chloride or carbamoyl bromide is used, the reactions are performed in the presence of a suitable base. Suitable bases include amines typically used as acid
25 scavengers, such as pyridine or triethylamine, or commercially available polymer bound bases such as polyvinylpyridine. If necessary, an excess of the isocyanate, isothiocyanate, carbamoyl chloride or carbamoyl
30 bromide is employed to ensure complete reaction of the starting amine. The reactions are performed at about ambient to about 80°C, for from about three hours to about three days. Typically, the product may be isolated by
35 washing the reaction mixture with water and concentrating the remaining organics under reduced pressure. When an excess of isocyanate, isothiocyanate, carbamoyl chloride or carbamoyl bromide has been used, however, a polymer bound

-60-

primary or secondary amine, such as an aminomethylated polystyrene, may be conveniently added to react with the excess reagent. Isolation of products from reactions where a polymer bound reagent has been used is greatly
5 simplified, requiring only filtration of the reaction mixture and then concentration of the filtrate under reduced pressure. The product from these reactions may be purified chromatographically or recrystallized from a suitable solvent if desired. The skilled artisan will
10 appreciate that compounds of the invention which are ureas may be converted into the corresponding thiourea by treatment with [2,4-bis(4-methoxyphenyl)-1,3-dithia-2,4-diphosphetane-2,4-disulfide] (Lawesson's Reagent) or phosphorus pentasulfide.

15 Compounds of the invention where X is -NHC(O)OR^{12} are prepared by reacting the 5-amino-3-(1,2,3,6-tetrahydropyridin-4-yl)-1H-indole or 5-amino-3-(piperidin-4-yl)-1H-indole with an appropriately substituted chloroformate in the presence of a suitable amine under the
20 conditions described in the previous paragraph. Likewise, compounds of the invention where X is $\text{-NR}^{13}\text{C(O)R}^{14}$ are prepared by reacting the 5-amino-3-(1,2,3,6-tetrahydropyridin-4-yl)-1H-indole or 5-amino-3-(piperidin-4-yl)-1H-indole with an appropriate carboxylic acid
25 chloride, bromide or anhydride, optionally in the presence of an acylation catalyst such as dimethylaminopyridine, in the presence of a suitable base, such as those described *supra*.

Alternatively, compounds of the invention where X is
30 $\text{-NR}^{13}\text{C(O)R}^{14}$ are prepared by reacting the 5-amino-3-(1,2,3,6-tetrahydropyridin-4-yl)-1H-indole or 5-amino-3-(piperidin-4-yl)-1H-indole with an appropriate carboxylic acid halide, carboxylic acid anhydride, or a carboxylic acid in the presence of typical peptide coupling reagents
35 such as N,N'-carbonyldiimidazole (CDI), N,N'-dicyclohexylcarbodiimide (DCC) and 1-(3-

dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (EDC). A polymer supported form of EDC has been described (*Tetrahedron Letters*, 34(48), 7685 (1993)) and is very useful for the preparation of the compounds of the present invention. The product from these reactions is isolated and purified as described above.

The skilled artisan will appreciate that the order in which the steps are performed to prepare the compounds of the present invention is not important in many cases. For example, compounds where X is $-NR^7SO_2R^8$ are accessible by subjecting the 5-amino-3-(1,2,3,6-tetrahydropyridin-4-yl)-1H-indoles or 5-amino-3-(piperidin-4-yl)-1H-indoles to the conditions illustrated in Synthetic Scheme I. Likewise, 5-aminoindole may be subjected to the reaction sequences illustrated in Synthetic Scheme V prior to reaction with a 4-piperidone as illustrated in Synthetic Scheme II. The skilled artisan will also appreciate that compounds where R is H may be prepared by condensing 4-piperidone with a suitably substituted indole to give the corresponding 3-(1,2,3,6-tetrahydropyridin-4-yl)-1H-indoles which may then be hydrogenated if desired. Alternatively, 1-benzyl-4-piperidone may be substituted at any point in the synthesis for a suitably substituted 4-piperidone. The benzyl group may then be removed by standard hydrogenation conditions after reactions for which the secondary amine would be incompatible are complete. The 3-(1,2,3,6-tetrahydropyridin-4-yl)-1H-indoles may also be reduced to the corresponding 3-(piperidin-4-yl)-1H-indoles at any convenient point in the synthetic sequence. These variations are made apparent in the following Preparations and Examples.

-62-

PREPARATION I

5-bromo-3-(1-methylpiperidin-4-yl)-1H-indole

Preparation of 5-bromo-3-(1-methyl-1,2,3,6-tetrahydropyridin-4-yl)-1H-indole

5 To a solution of 56.11 gm (306 mMol) potassium hydroxide in 300 mL methanol were added 38 mL (306 mMol) 1-methyl-4-piperidone followed by 30.0 gm (153 mMol) 5-bromo-1H-indole. The reaction mixture was stirred at reflux for 18 hours. The reaction mixture was then cooled to ambient
10 and diluted with 1.5 L water. The resultant white solid was filtered, washed sequentially with water and diethyl ether, and then dried under vacuum to give 44.6 gm (100%) 5-bromo-3-(1-methyl-1,2,3,6-tetrahydro-4-pyridinyl)-1H-indole.

15 Catalytic hydrogenation

To a solution of 44.6 gm (153 mMol) 5-bromo-3-(1-methyl-1,2,3,6-tetrahydro-4-pyridinyl)-1H-indole in 1.95 L tetrahydrofuran were added 9.0 gm platinum oxide. The reaction mixture was hydrogenated with an initial hydrogen
20 pressure of 60 p.s.i. at ambient temperature for 24 hours. The reaction mixture was filtered and the filtrate concentrated under reduced pressure. The residue was recrystallized from acetonitrile to give 32.6 gm (73.7%) of the title compound as a white solid.

5-methylamino-1H-indole

A. Preparation of N-ethoxycarbonyl-5-amino-1H-indole

To a solution of 4.27 gm (32.3 mMol) 5-amino-1H-indole in 50 mL tetrahydrofuran were added 5.4 mL (38.8 mMol) triethylamine and the reaction mixture was then cooled to 0°C. To this solution were then added dropwise 3.4 mL (35.5 mMol) ethyl chloroformate. After 4 hours the reaction mixture was diluted with 1N HCl and was then extracted with ethyl acetate. The organic phase was washed sequentially with 1N HCl, water and saturated aqueous sodium chloride. The remaining organics were dried over sodium sulfate and concentrated under reduced pressure to give 7.4 gm of a dark oil. This oil was purified by flash chromatography, eluting with a gradient of dichloromethane containing 0-2.5% methanol, to give 4.95 gm (75%) of the title compound as a tan solid.

B. Reduction of N-ethoxycarbonyl-5-amino-1H-indole

To a suspension of 6.3 gm (164.5 mMol) lithium aluminum hydride in 50 mL tetrahydrofuran was added dropwise a solution of 4.8 gm (23.5 mMol) N-ethoxycarbonyl-5-amino-1H-indole in 40 mL tetrahydrofuran. The reaction mixture was heated to reflux until the starting material was consumed as measured by thin-layer chromatography. The reaction mixture was then cooled to ambient and treated with saturated aqueous sodium sulfate to destroy excess lithium aluminum hydride. The resulting suspension was filtered and the filtrate concentrated under reduced

5-amino-3-(1-methylpiperidin-4-yl)-1H-indole

A. From 5-nitro-1H-indole

To a solution of 10.38 gm (185 mMol) potassium
5 hydroxide in 200 mL methanol were added 10.0 gm (61.7 mMol)
5-nitro-1H-indole followed by 13.96 gm (123 mMol) 1-methyl-
4-piperidone. The mixture was heated to reflux for 4 days
under a nitrogen atmosphere. The reaction mixture was then
allowed to cool to ambient and the solid which formed
10 filtered and washed with methanol. This solid was dried
under vacuum at 50°C. The combined filtrates were then
concentrated under reduced pressure and the residue
subjected to flash chromatography, eluting with 92.5:7.5
dichloromethane:methanol. Fractions shown to contain
15 product were combined and concentrated under reduced
pressure. This solid was combined with that isolated
directly from the reaction mixture to give 13.79 gm (87%)
5-nitro-3-(1-methyl-1,2,3,6-tetrahydropyridin-4-yl)-1H-
indole.

20 To a solution of 38.2 gm (145 mMol) 5-nitro-3-(1-
methyl-1,2,3,6-tetrahydropyridin-4-yl)-1H-indole in 1.9 L
ethanol and 30 mL 5N HCl were added 10.0 gm 5% palladium on
carbon. The reaction mixture was hydrogenated at ambient
for 18 hours with an initial hydrogen pressure of 60 p.s.i.
25 The reaction mixture was filtered and then concentrated
under reduced pressure. The residue was dissolved in
methanol and the solution filtered. This filtrate was
concentrated under reduced pressure and the residue
redissolved in ethanol. The solution was concentrated to
30 about 500 mL and product allowed to crystallize. The
crystals were filtered to give 48.9 gm (95%) of the title
compound as its dihydrochloride salt, ethanol solvate.

Preparation of a polystyrene bound isocyanate resin

To a stirred suspension of 50 gm (61 mMol) aminomethylated polystyrene resin (1.22 mMol/gm) in 800 mL toluene was added 193 mL (366 mMol) 1.9 M phosgene in toluene. After stirring the reaction mixture for 10 minutes, 67 mL (482 mMol) triethylamine was added and the reaction mixture was stirred for 18 hours at room temperature. The mixture was filtered and the recovered solid washed with 10 times with dichloromethane. A light pink resin mixed with a white solid was obtained. This solid mixture was resuspended in 700 mL dichloromethane, stirred for 10 minutes and then filtered and washed well with dichloromethane. The resulting solid was again suspended, stirred and washed with dichloromethane to provide the desired resin.

EXAMPLE 20

5-(4-chlorobenzoyl)-3-(1-methylpiperidin-4-yl)-1H-indole

To a suspension of 0.21 gm (1.05 mMol) potassium
hydride in 5.0 mL tetrahydrofuran at 0°C were added a
5 solution of 0.3 gm (1.0 mMol) 5-bromo-3-(1-methylpiperidin-
4-yl)-1H-indole in 5.0 mL tetrahydrofuran and the solution
stirred for about 30 minutes. The resulting mixture was
cooled to about -78°C and to it were added 1.47 mL (2.3
mMol) t-butyllithium, which had been precooled to -78°C,
10 via cannula. After about 15 minutes, a solution of 1.0 gm
(5.0 mMol) N-methyl-N-methoxy-4-chlorobenzamide
(Preparation VII) in 3.0 mL tetrahydrofuran were added.
The reaction mixture was allowed to gradually warm to
ambient and was then quenched with 2N sodium hydroxide.
15 The mixture extracted well with diethyl ether and the ether
extracts were then washed with saturated aqueous sodium
chloride, dried over sodium sulfate and concentrated under
reduced pressure. The residue was purified by radial
chromatography (2 mm silica), eluting with 95:5 ethyl

5-(fur-2-oyl)amino-3-(1-methyl-1,2,3,6-tetrahydropyridin-4-yl)-1H-indole

A. Preparation of 5-(2-furoyl)amino-1H-indole

5 To a solution of 2.09 gm (15.8 mMol) 5-amino-1H-indole in 20 mL tetrahydrofuran were added 2.6 mL (18.97 mMol) triethylamine and the solution was cooled in an ice bath. To the reaction mixture were then added dropwise 1.71 ml (17.4 mMol) 2-furoyl chloride. When this addition was
10 complete the cooling bath was removed and the reaction mixture was stirred 1.5 hours at ambient temperature. At this point the reaction was diluted with water and extracted well with ethyl acetate. The organic solutions were combined and washed sequentially with water, 2N sodium
15 hydroxide, water and saturated aqueous sodium chloride. The remaining organics were then dried over sodium sulfate and concentrated under reduced pressure to give a dark purple solid. The solid was subjected to flash chromatography, eluting with a gradient of dichloromethane containing 0-2% methanol. The recovered solid was
20 crystallized from ethyl acetate to give 1.8 gm (50.3%) of 5-(2-furoyl)amino-1H-indole as pale purple crystals.

After 18 hours the reaction mixture was cooled in an ice bath. The reaction mixture was the partitioned between 100 mL ethyl acetate and 100 mL 2N sodium hydroxide. The phases were separated and the aqueous extracted again with ethyl acetate. Organic extracts were combined and washed sequentially with 2N sodium hydroxide, water and saturated aqueous sodium chloride. The remaining organics were dried over sodium sulfate and concentrated under reduced pressure. The residue was subjected to radial chromatography (2 mm silica), eluting with 100:10:1 dichloromethane:methanol:ammonium hydroxide. Fractions containing product were combined and concentrated under reduced pressure. Alternate Synthesis of 5-(2-thienoyl)amino-3-(1-methylpiperidin-4-yl)-1H-indole oxalate

To a solution of 0.615 gm (4.8 mMol) 2-thienoic acid in 10 mL dichloromethane were added 0.778 gm (4.8 mMol) N,N-carbonyldiimidazole in 2 mL dichloromethane. After 1.5 hour, a solution of 1.0 gm (4.4 mMol) 5-amino-3-(1-methylpiperidin-4-yl)-1H-indole in 15 mL dichloromethane was added and the reaction mixture stirred for 18 hours at ambient. The reaction mixture was washed sequentially with 1N sodium hydroxide, water and saturated aqueous sodium chloride. The remaining organics were dried over sodium sulfate and the volatiles removed under reduced pressure. The residual brown foam was subjected to radial chromatography (2 mm silica), eluting with a gradient of dichloromethane containing 5-7.5% methanol and 0.5% ammonium hydroxide. Fractions shown to contain product were combined and concentrated under reduced pressure. This material was dissolved in ethyl acetate/ethanol and

-114-

was treated with oxalic acid to give 0.20 gm (10.7%) of the title compound as a tan solid.

General procedure for the coupling of carboxylic acids with
5-amino-3-(1-methylpiperidin-4-yl)-1H-indole

- 10 To a suspension of 4-5 equivalents of polymer bound 1-ethyl-3-(3-dimethylaminopropyl)carbodiimide (Desai, et al., *Tetrahedron Letters*, **34**(48), 7685 (1993)) in chloroform are added 1 equivalent of 5-amino-3-(1-methylpiperidin-4-yl)-1H-indole and 2-3 equivalents of the carboxylic acid.
- 15 The reaction is agitated until the reaction is complete, heat may be applied if necessary. The resin is removed by filtration and the product isolated by evaporation of solvent. This procedure is illustrated by Examples 126-178.

25 General Procedure for the Coupling of Amines with Indole 5-carboxylic acids

A mixture of 15 mg (0.058 mMol) 5-carboxy-3-(1-methyl-1,2,5,6-tetrahydropyridin-4-yl)-1H-indole, 18 mg (0.088 mMol) dicyclohexylcarbodiimide, 12 mg (0.088 mMol) hydroxybenzotriazole, and 1.5 equivalents of an appropriate amine in 2 mL dimethylformamide are heated at 75°C for 18 hours. The reaction is allowed to cool and is then loaded onto a VARIAN BOND ELUT SCXTM (Varian, Harbor City, CA, U.S.A.) ion exchange column (3 mL/0.5 gm). The column is washed with 6 mL methanol and then the desired compound is stripped from the column by eluting with 2M ammonium hydroxide in methanol. This eluant is concentrated under

-135-

reduced pressure and the residue dissolved in 2 mL dichloromethane. To this solution is added 0.118 gm (0.118 mMol) of a polystyrene bound isocyanate resin and the mixture agitated for 18 hours. The reaction mixture is
5 filtered and concentrated under reduced pressure to provide the amides of the invention. If desired, the compound may be further purified by loading onto a VARIAN BOND ELUT SAXTM (Varian, Harbor City, CA, U.S.A.) ion exchange column (10 mL/0.5 gm). The desired compound is stripped from the
10 column by eluting with methanol and concentrating the eluant under reduced pressure. The compounds of Examples 188-202 were prepared by this procedure.

15 To demonstrate the use of the compounds of this
invention in the treatment of migraine, their ability to
bind to the 5-HT_{1F} receptor subtype was determined. The
ability of the compounds of this invention to bind to the
5-HT_{1F} receptor subtype was measured essentially as
20 described in N. Adham, et al., *Proceedings of the National
Academy of Sciences (USA)*, 90, 408-412 (1993).

Membrane Preparation: Membranes were prepared from
transfected Ltk- cells which were grown to 100% confluency.
The cells were washed twice with phosphate-buffered saline,
25 scraped from the culture dishes into 5 mL of ice-cold
phosphate-buffered saline, and centrifuged at 200 x g for 5
minutes at 4°C. The pellet was resuspended in 2.5 mL of
ice-cold Tris buffer (20 mM Tris HCl, pH=7.4 at 23°C, 5 mM
EDTA) and homogenized with a Wheaton tissue grinder. The
30 lysate was subsequently centrifuged at 200 x g for 5
minutes at 4°C to pellet large fragments which were
discarded. The supernatant was collected and centrifuged
at 40,000 x g for 20 minutes at 4°C. The pellet resulting
from this centrifugation was washed once in ice-cold Tris
35 wash buffer and resuspended in a final buffer containing 50
mM Tris HCl and 0.5 mM EDTA, pH=7.4 at 23°C. Membrane
preparations were kept on ice and utilized within two hours

-139-

for the radioligand binding assays. Protein concentrations were determined by the method of Bradford (*Anal. Biochem.*, **72**, 248-254 (1976)).

Radioligand Binding: [³H-5-HT] binding was performed using slight modifications of the 5-HT_{1D} assay conditions reported by Herrick-Davis and Titeler (*J. Neurochem.*, **50**, 1624-1631 (1988)) with the omission of masking ligands. Radioligand binding studies were achieved at 37°C in a total volume of 250 µL of buffer (50 mM Tris, 10 mM MgCl₂, 0.2 mM EDTA, 10 µM pargyline, 0.1% ascorbate, pH=7.4 at 37°C) in 96 well microtiter plates. Saturation studies were conducted using [³H]5-HT at 12 different concentrations ranging from 0.5 nM to 100 nM. Displacement studies were performed using 4.5-5.5 nM [³H]5-HT. The binding profile of drugs in competition experiments was accomplished using 6-12 concentrations of compound. Incubation times were 30 minutes for both saturation and displacement studies based upon initial investigations which determined equilibrium binding conditions. Nonspecific binding was defined in the presence of 10 µM 5-HT. Binding was initiated by the addition of 50 µL membrane homogenates (10-20 µg). The reaction was terminated by rapid filtration through presoaked (0.5% polyethyleneimine) filters using 48R Cell Brandel Harvester (Gaithersburg, MD). Subsequently, filters were washed for 5 seconds with ice cold buffer (50 mM Tris HCl, pH=7.4 at 4°C), dried and placed into vials containing 2.5 mL Radi-Safe (Beckman, Fullerton, CA) and radioactivity was measured using a Beckman LS 5000TA liquid scintillation counter. The efficiency of counting of [³H]5-HT averaged between 45-50%. Binding data was analyzed by computer-assisted nonlinear regression analysis (Accufit and Accucomp, Lunden Software, Chagrin Falls, OH). IC₅₀ values were converted to K_i values using the Cheng-Prusoff equation (*Biochem. Pharmacol.*, **22**, 3099-3108 (1973)). All experiments were performed in triplicate. Representative compounds of this invention were found to have affinity for

-140-

the 5-HT_{1F} receptor as measured by the procedure described *supra*.

As was reported by R.L. Weinshank, *et al.*, WO93/14201, the 5-HT_{1F} receptor is functionally coupled to a G-protein as measured by the ability of serotonin and serotonergic

drugs to inhibit forskolin stimulated cAMP production in NIH3T3 cells transfected with the 5-HT_{1F} receptor. Adenylate cyclase activity was determined using standard techniques. A maximal effect is achieved by serotonin. An E_{max} is determined by dividing the inhibition of a test compound by the maximal effect and determining a percent inhibition. (N. Adham, *et al.*, *supra*; R.L. Weinshank, *et al.*, *Proceedings of the National Academy of Sciences (USA)*, 89,3630-3634 (1992)), and the references cited therein.

Measurement of cAMP formation

Transfected NIH3T3 cells (estimated B_{max} from one point competition studies=488 fmol/mg of protein) were incubated in DMEM, 5 mM theophylline, 10 mM HEPES (4-[2-hydroxyethyl]-1-piperazineethanesulfonic acid) and 10 μ M pargyline for 20 minutes at 37°C, 5% CO₂. Drug dose-effect curves were then conducted by adding 6 different final concentrations of drug, followed immediately by the addition of forskolin (10 μ M). Subsequently, the cells were

incubated for an additional 10 minutes at 37°C, 5% CO₂. The medium was aspirated and the reaction was stopped by the addition of 100 mM HCl. To demonstrate competitive antagonism, a dose-response curve for 5-HT was measured in parallel, using a fixed dose of methiothepin (0.32 μ M).

The plates were stored at 4°C for 15 minutes and then centrifuged for 5 minutes at 500 x g to pellet cellular debris, and the supernatant was aliquoted and stored at -20°C before assessment of cAMP formation by radioimmunoassay (cAMP radioimmunoassay kit; Advanced

Magnetics, Cambridge, MA). Radioactivity was quantified using a Packard COBRA Auto Gamma counter, equipped with

-141-

data reduction software. All of the compounds shown to have affinity for the 5-HT_{1F} receptor were tested and found to be agonists at the 5-HT_{1F} receptor in the cAMP assay.

5 The discovery that the pain associated with migraine and associated disorders is inhibited by activation of the 5-HT_{1F} receptor by administration of 5-HT_{1F} agonists required the analysis of data from diverse assays of pharmacological activity. To establish that the 5-HT_{1F} receptor subtype is responsible for mediating neurogenic
10 meningeal extravasation which leads to the pain of migraine, the binding affinity of a panel of compounds to serotonin receptors was measured first, using standard procedures. For example, the ability of a compound to bind to the 5-HT_{1F} receptor subtype was performed as described
15 *supra*. For comparison purposes, the binding affinities of compounds to the 5-HT_{1D α} , 5-HT_{1D β} , and 5-HT_{1E} receptors were also determined as described *supra*, except that different cloned receptors were employed in place of the 5-HT_{1F} receptor clone employed therein. The same panel was
20 then tested in the cAMP assay to determine their agonist or antagonist character. Finally, the ability of these compounds to inhibit neuronal protein extravasation, a functional assay for migraine pain, was measured.

25 The panel of compounds used in this study represents distinct structural classes of compounds which were shown to exhibit a wide range of affinities for the serotonin receptors assayed. Additionally, the panel compounds were shown to have a wide efficacy range in the neuronal protein extravasation assay as well. The panel of compounds
30 selected for this study are described below.

Compound I

3-[2-(dimethylamino)ethyl]-N-methyl-1H-indole-5-methanesulfonamide butane-1,4-dioate (1:1)
(Sumatriptan succinate)

5

Sumatriptan succinate is commercially available as ImitrexTM or may be prepared as described in United States Patent 5,037,845, issued August 6, 1991, which is herein incorporated by reference.

10

Compound II

5-fluoro-3-(1-(2-(1-methyl-1H-pyrazol-4-yl)ethyl)-4-piperidinyl)-1H-indole hydrochloride

15

Compound II is available by the following procedure.

20

2-(1-methyl-3-pyrazolo)-1-ethanol

To a mixture of 200 gm (2.85 mole) 2,3-dihydrofuran and 800 mL (4.81 mole) triethylorthoformate were added 0.8

-143-

mL (6.5 mMol) boron trifluoride diethyl etherate dropwise. After an initial exotherm the reaction mixture was allowed to stir at ambient temperature for four days. To the reaction mixture was then added 4.0 gm potassium carbonate and the reaction mixture was distilled under 6.0 mm Hg. Fractions distilling between 60°C and 130°C were collected to give 261.64 gm (42.1%) of a light yellow oil.

MS(m/e): 219(M⁺)

To a solution of 87.2 gm (0.40 mole) of the previously prepared yellow oil in 787 mL 1N HCl were added 21.3 mL (0.40 mole) methyl hydrazine and the reaction mixture was stirred at reflux for four hours. The reaction mixture was cooled to ambient temperature and the volatiles were removed under reduced pressure. The residual oil was treated with 2N NaOH until basic and the aqueous extracted well with dichloromethane. The combined organic extracts were dried over sodium sulfate and concentrated under reduced pressure to give 32.15 gm (64.5%) of the title compound as a brown oil.

MS(m/e): 126(M⁺)

¹H-NMR(DMSO-d₆): δ7.45 (s, 1H); 7.25 (s, 1H); 4.65 (t, 1H); 3.75 (s, 3H); 3.55 (m, 2H); 2.55 (t, 2H).

1-methyl-4-(2-methanesulfonyloxvethyl)pyrazole

To a solution of 16.0 gm (127 mMol) 2-(1-methyl-3-pyrazolo)-1-ethanol and 27 mL (193 mMol) triethylamine in 550 mL tetrahydrofuran were added 10.8 mL (140 mMol) methanesulfonyl chloride with icebath cooling. Once the addition was complete, the reaction mixture was stirred at ambient for 4 hours. The volatiles were then removed under reduced pressure and the residue partitioned between water and dichloromethane. The organic phase was washed with water followed by saturated aqueous sodium chloride and the remaining organics dried over sodium sulfate. The solvent was removed under reduced pressure to give a crude yield of 28.4 gm of the title compound as a brown oil. The product was used without further purification.

-144-

5-fluoro-3-[1,2,3,6-tetrahydro-4-pyridyl]-1H-indole

To a solution of 74 gm potassium hydroxide in 673 mL methanol were added 10.0 gm (74 mMol) 5-fluoroindole and
5 23.3 gm (151 mMol) 4-piperidone•HCl•H₂O. The reaction mixture was stirred at reflux for 18 hours. The reaction mixture was diluted with 1.3 L of water and the resulting precipitate recovered by filtration and dried under reduced pressure to give 10.75 gm (67.2%) of 5-fluoro-3-[1,2,5,6-
10 tetrahydro-4-pyridyl]-1H-indole as a yellow solid.

5-fluoro-3-(4-piperidinyl)-1H-indole

To a solution of 10.75 gm (50 mMol) 5-fluoro-3-[1,2,5,6-tetrahydro-4-pyridyl]-1H-indole in 500 mL ethanol
15 were added 2.0 gm 5% palladium on carbon and the reaction mixture hydrogenated at ambient temperature for 18 hours at an initial hydrogen pressure of 60 p.s.i. The reaction mixture was then filtered through a pad of celite and the filtrate concentrated under reduced pressure to give an
20 off-white solid. The solid was recrystallized from methanol to give 8.31 gm (76.2%) of the title compound as a colorless solid.

Alkylation

To a solution of 2.0 gm (9.2 mMol) 5-fluoro-3-(4-piperidinyl)-1H-indole and 2.4 gm (23 mMol) sodium
30 carbonate in 50 mL dimethylformamide were added 1.87 gm (9.2 mMol) 1-methyl-4-(2-methanesulfonyloxyethyl)pyrazole in 5 mL dimethylformamide. The reaction mixture was stirred at 100°C for 18 hours. The reaction mixture was
35 cooled to ambient and the solvent removed under reduced pressure. The residue was partitioned between dichloromethane and water and the phases separated. The

-145-

organic phase was washed well with water followed by saturated aqueous sodium chloride. The remaining organic phase was dried over sodium sulfate and concentrated under reduced pressure. The residual oil was subjected to silica gel chromatography, eluting with 20:1 dichloromethane:methanol. Fractions shown to contain the desired compound were combined and concentrated under reduced pressure to give a yellow oil. The oil was converted to the hydrochloride salt and was crystallized from ethyl acetate/methanol. 1.61 gm (51.1%) of Compound II were recovered as colorless crystals.

Compound III

5-hydroxy-3-(4-piperidinyl)-1H-indole oxalate

Compound III is available by the following procedure.

5-benzyloxy-3-[1,2,5,6-tetrahydro-4-pyridinyl]-1H-indole

Starting with 5.0 gm (22 mMol) 5-benzyloxyindole and 6.88 gm (45 mMol) 4-piperidone•HCl•H₂O, 6.53 gm (97.6%) of 5-benzyloxy-3-[1,2,5,6-tetrahydro-4-pyridinyl]-1H-indole were recovered as a light yellow solid by the procedure described in Preparation I. The material was used in the subsequent step without further purification.

-146-

Hydrogenation/Hydrogenolysis

To a solution of 1.23 gm (4 mMol) 5-benzyloxy-3-[1,2,5,6-tetrahydro-4-pyridinyl]-1H-indole in 50 mL 1:1 tetrahydrofuran:ethanol were added 0.3 gm 5% palladium on carbon and the reaction mixture hydrogenated at ambient temperature for 18 hours with an initial hydrogen pressure of 60 p.s.i. The reaction mixture was then filtered through a celite pad and the filtrate concentrated under reduced pressure. The residue was converted to the oxalate salt and 0.98 gm (80.0%) of Compound III were recovered as a brown foam.

m.p.=67°C

Calculated for C₁₃H₁₆N₂O•C₂H₂O₄: Theory: C, 58.81; H, 5.92; N, 9.14. Found: C, 58.70; H, 5.95; N, 9.39.

Compound IV

8-chloro-2-diethylamino-1,2,3,4-tetrahydronaphthalene hydrochloride

Compound IV is available by the following procedure.

8-chloro-2-tetralone

A mixture of 30.0 gm (0.176 mole) of *o*-chlorophenyl-acetic acid and 40.0 mL of thionyl chloride was stirred at ambient temperature for 18 hours. The volatiles were then removed in vacuo to give 32.76 gm (99.0 %) of *o*-chloro-phenylacetyl chloride as a transparent, pale yellow, mobile liquid.

NMR(CDCl₃): 7.5-7.1 (m, 4H), 4.2 (s, 2H).

To a slurry of 46.5 gm (0.348 mole) AlCl₃ in 400 mL dichloromethane at -78°C was added a solution of 32.76 gm

-147-

(0.174 mole) of the previously prepared *o*-chlorophenylacetyl chloride in 100 mL dichloromethane dropwise over 1 hour. The dry ice/acetone bath then was replaced with an ice/water bath and ethylene was bubbled into the reaction mixture during which time the temperature rose to 15°C. The ethylene addition was discontinued at the end of the exotherm and the reaction mixture was stirred at about 5°C for 4 hours. Ice was then added to the reaction mixture to destroy aluminum complexes. Upon termination of the exotherm, the reaction mixture was diluted with 500 mL of water and stirred vigorously until all solids had dissolved. The phases were separated and the organic phase was washed with 3x400 mL 1N hydrochloric acid and 2x400 mL saturated aqueous sodium bicarbonate. The remaining organic phase was then dried over sodium sulfate and concentrated in vacuo to give a pale orange residue. The residue was dissolved in 1:1 hexane:diethyl ether and was poured over a flash silica column which was then eluted with 1:1 hexane:diethyl ether to give a light yellow residue which was crystallized from 4:1 hexane:diethyl ether to give 10.55 gm of the title compound.

NMR(CDCl₃): 7.5-7.2 (m, 3H), 3.7 (s, 2H), 3.3-3.0 (t, J=7 Hz, 2H), 2.8-2.4 (t, J=7 Hz, 2H).

Reductive Amination

To a solution of 0.5 gm (2.78 mMol) 8-chloro-2-tetralone in 25 mL cyclohexane were added 1.4 mL (13.9 mMol) diethylamine followed by 0.1 gm *p*-toluenesulfonic acid monohydrate. The reaction mixture was then heated at reflux with constant water removal (Dean-Stark Trap) for 18 hours. The reaction mixture was then cooled to ambient and

-148-

the volatiles removed under reduced pressure. The residue was then dissolved in 15 mL methanol to which were then added 1.5 mL acetic acid followed by the portionwise addition of 0.5 gm sodium borohydride. The reaction mixture was then stirred for 1 hour at ambient.

The reaction mixture was then diluted with 20 mL 10% HCl and stirred for an additional hour. The mixture was then extracted with diethyl ether and the remaining aqueous phase was poured over ice, made basic with ammonium hydroxide and extracted well with dichloromethane. These extracts were combined, dried over sodium sulfate and concentrated under reduced pressure. The residue was redissolved in dichloromethane and subjected to chromatography over basic alumina, eluting with dichloromethane. Fractions shown to contain product were combined and concentrated under reduced pressure. The residual oil was dissolved in diethyl ether and the solution saturated with hydrogen chloride. The viscous residue was crystallized from acetone/diethyl ether to give 0.20 gm (23.2 %) of Compound IV as colorless crystals.

Compound V

6-hydroxy-3-dimethylamino-1,2,3,4-tetrahydrocarbazole

-149-

Compound V is available by the following procedure.

4-dimethylamino-1-cyclohexanone ethylene ketal

To a solution of 5.0 gm (32 mMol) 1,4-cyclohexanedione
5 mono-ethylene ketal and 10.80 gm (240 mMol) dimethylamine
were added 2.0 mL acetic acid and the mixture was stirred
at 0°C for 1.5 hours. To this solution were then added
3.62 gm (58 mMol) sodium cyanoborohydride and the reaction
10 stirred for an additional hour at ambient. The pH of the
reaction mixture was adjusted to ~7 with 16 mL acetic acid
and stirred 18 hours at ambient. The volatiles were
removed under reduced pressure and the residue dissolved in
cold 5% tartaric acid solution and then the aqueous phase
was made basic with 5N sodium hydroxide. This aqueous
15 phase was extracted well with dichloromethane. These
organic extracts were combined and concentrated under
reduced pressure to give 5.04 gm (85%) of the title
compound as an oil.

20 4-dimethylamino-1-cyclohexanone

4.96 gm (26.8 mMol) 4-dimethylamino-1-cyclohexanone
ethylene ketal were dissolved in 50 mL formic acid and the
solution stirred at reflux for 18 hours. The reaction
mixture was then cooled to ambient and the volatiles
25 removed under reduced pressure to give 3.78 gm (100%) of
the title compound.

6-benzyloxy-3-dimethylamino-1,2,3,4-tetrahydrocarbazole

To a solution of 3.78 gm (26.8 mMol) 4-dimethylamino-
30 1-cyclohexanone and 6.69 gm (26.8 mMol) 4-benzyloxyphenyl-
hydrazine hydrochloride in 50 mL ethanol were added 2.17 mL
(26.8 mMol) pyridine. To this solution were added 5x10 mL
portions of water and the reaction mixture then stored at
0°C for 18 hours. The reaction mixture was then diluted
35 with an additional 50 mL of water and the mixture extracted
well with dichloromethane. The combined organic extracts
were dried over sodium sulfate and the volatiles removed

-150-

under reduced pressure. The residual oil was subjected to flash silica gel chromatography, eluting with 9:1 chloroform:methanol. Fractions shown to contain the desired product were combined and concentrated under reduced pressure to give 2.14 gm (24.9%) of the title compound.

Hydrogenolysis

To a solution of 2.14 gm (6.7 mMol) 6-benzyloxy-3-dimethylamino-1,2,3,4-tetrahydrocarbazole in 50 mL ethanol were added 0.20 gm 10% palladium on carbon and the reaction mixture was hydrogenated at ambient temperature with an initial hydrogen pressure of 40 p.s.i. After 5 hours an additional charge of 0.20 gm 10% palladium on carbon were added and the reaction mixture repressurized with hydrogen to 40 p.s.i. for 4 hours. The reaction mixture was then filtered through a pad of celite and the filtrate concentrated under reduced pressure. The residue was subjected to Florisil chromatography, eluting with 9:1 chloroform:methanol. Fractions shown to contain the desired compound were combined and concentrated under reduced pressure. The residue was again subjected to Florisil chromatography, eluting with a gradient consisting of chloroform containing 2-10% methanol. Fractions shown to contain product were combined and concentrated under reduced pressure to give Compound V as a crystalline solid.

cAMP Formation

10 All of the compounds of the panel were tested in the cAMP formation assay described *supra* and all were found to be agonists of the 5-HT_{1F} receptor.

Protein Extravasation

15 Harlan Sprague-Dawley rats (225-325 g) or guinea pigs from Charles River Laboratories (225-325 g) were anesthetized with sodium pentobarbital intraperitoneally (65 mg/kg or 45 mg/kg respectively) and placed in a stereotaxic frame (David Kopf Instruments) with the incisor bar set at -3.5 mm for rats or -4.0 mm for guinea pigs. Following a midline sagittal scalp incision, two pairs of
 20 bilateral holes were drilled through the skull (6 mm posteriorly, 2.0 and 4.0 mm laterally in rats; 4 mm posteriorly and 3.2 and 5.2 mm laterally in guinea pigs, all coordinates referenced to bregma). Pairs of stainless steel stimulating electrodes (Rhodes Medical Systems, Inc.)

-152-

were lowered through the holes in both hemispheres to a depth of 9 mm (rats) or 10.5 mm (guinea pigs) from dura.

The femoral vein was exposed and a dose of the test compound was injected intravenously (1 mL/kg).

5 Approximately 7 minutes later, a 50 mg/kg dose of Evans Blue, a fluorescent dye, was also injected intravenously. The Evans Blue complexed with proteins in the blood and functioned as a marker for protein extravasation. Exactly 10 minutes post-injection of the test compound, the left
10 trigeminal ganglion was stimulated for 3 minutes at a current intensity of 1.0 mA (5 Hz, 4 msec duration) with a Model 273 potentiostat/ galvanostat (EG&G Princeton Applied Research).

15 Fifteen minutes following stimulation, the animals were killed and exsanguinated with 20 mL of saline. The top of the skull was removed to facilitate the collection of the dural membranes. The membrane samples were removed from both hemispheres, rinsed with water, and spread flat on microscopic slides. Once dried, the tissues were
20 coverslipped with a 70% glycerol/water solution.

A fluorescence microscope (Zeiss) equipped with a grating monochromator and a spectrophotometer was used to quantify the amount of Evans Blue dye in each sample. An excitation wavelength of approximately 535 nm was utilized
25 and the emission intensity at 600 nm was determined. The microscope was equipped with a motorized stage and also interfaced with a personal computer. This facilitated the computer-controlled movement of the stage with fluorescence measurements at 25 points (500 μ m steps) on each dural
30 sample. The mean and standard deviation of the measurements was determined by the computer.

The extravasation induced by the electrical stimulation of the trigeminal ganglion was an ipsilateral effect (i.e. occurs only on the side of the dura in which
35 the trigeminal ganglion was stimulated). This allows the other (unstimulated) half of the dura to be used as a control. The ratio of the amount of extravasation in the

-153-

dura from the stimulated side compared to the unstimulated side dura was calculated. Saline controls yielded a ratio of approximately 2.0 in rats and 1.8 in guinea pigs. In contrast, a compound which effectively prevented the extravasation in the dura from the stimulated side would have a ratio of approximately 1.0. A dose-response curve was generated and the dose that inhibited the extravasation by 50% (ID₅₀) was approximated. This data is presented in Table II.

Table II
Inhibition of Protein Extravasation (ID₅₀ mMol/kg)

<u>Compound</u>	<u>i.v. ID₅₀</u> <u>(mMol/kg)</u>
I	2.6x10 ⁻⁸
II	8.6x10 ⁻¹⁰

To determine the relationship of binding at various serotonin receptors to inhibition of neuronal protein extravasation, the binding affinity of all of the compounds to each of the 5-HT_{1D} α , 5-HT_{1D} β , 5-HT_{1E} and 5-HT_{1F} receptors was plotted against their ID₅₀ in the protein extravasation model. A linear regression analysis was performed on each set of data and a correlation factor, R², calculated. The results of this analysis are summarized in Table III.

-154-

Table III
Correlation Factor (R^2) for Specific 5-HT₁ Subtype Binding
Affinity vs Inhibition of Protein Extravasation

<u>5-HT₁ Subtype</u>	<u>Correlation Factor (R^2)</u>
5-HT _{1D} α	0.07
5-HT _{1D} β	0.001
5-HT _{1E}	0.31
5-HT _{1F}	0.94

5

An ideally linear relationship would generate a correlation factor of 1.0, indicating a cause and effect relationship between the two variables. The experimentally determined correlation factor between inhibition of neuronal protein extravasation and 5-HT_{1F} binding affinity is 0.94. This nearly ideal dependence of the ID₅₀ in the protein extravasation model on binding affinity to the 5-HT_{1F} receptor clearly demonstrates that the 5-HT_{1F} receptor mediates the inhibition of protein extravasation resulting from stimulation of the trigeminal ganglia.

15

Sumatriptan exhibits low bioavailability and relatively short duration of action. Its affinity for a number of serotonin receptor subtypes gives rise to undesirable side effects, particularly vasoconstriction, which severely limits its utility in the treatment of migraine. The compounds of this invention, however, are highly bioavailable through several routes of administration including, but not limited to, oral, buccal, intravenous, subcutaneous, intranasal, intraocular, transdermal, rectal and by inhalation. They exhibit a rapid onset and long duration of action, typically requiring only a single dose per day to maintain therapeutic levels. Since compounds of this invention are potent agonists of the 5-HT_{1F} receptor, extremely low doses are required to maintain therapeutic levels. Additionally, due to the high selectivity of compounds of this invention for the 5-HT_{1F} receptor, complications due to

20

25

30

-155-

vasoconstriction are avoided. Compounds of this invention also inhibit protein extravasation if administered prior or subsequent to stimulation of the trigeminal ganglia, suggesting they may be administered prior to an incipient
5 migraine attack to prevent pain, or during a migraine attack to alleviate pain.

While it is possible to administer a compound employed in the methods of this invention directly without any formulation, the compounds are usually administered in the
10 form of pharmaceutical compositions comprising a pharmaceutically acceptable excipient and at least one active ingredient. These compositions can be administered by a variety of routes including oral, buccal, rectal, intranasal, transdermal, subcutaneous, intravenous,
15 intramuscular, and intranasal. Many of the compounds employed in the methods of this invention are effective as both injectable and oral compositions. Such compositions are prepared in a manner well known in the pharmaceutical art and comprise at least one active compound. See, e.g.,
20 REMINGTON'S PHARMACEUTICAL SCIENCES, (16th ed. 1980).

In making the compositions employed in the present invention the active ingredient is usually mixed with an excipient, diluted by an excipient or enclosed within such a carrier which can be in the form of a capsule, sachet,
25 paper or other container. When the excipient serves as a diluent, it can be a solid, semi-solid, or liquid material, which acts as a vehicle, carrier or medium for the active ingredient. Thus, the compositions can be in the form of tablets, pills, powders, lozenges, sachets, cachets,
30 elixirs, suspensions, emulsions, solutions, syrups, aerosols (as a solid or in a liquid medium), ointments containing for example up to 10% by weight of the active compound, soft and hard gelatin capsules, suppositories, sterile injectable solutions, and sterile packaged powders.

35 In preparing a formulation, it may be necessary to mill the active compound to provide the appropriate particle size prior to combining with the other

-156-

ingredients. If the active compound is substantially insoluble, it ordinarily is milled to a particle size of less than 200 mesh. If the active compound is substantially water soluble, the particle size is normally
5 adjusted by milling to provide a substantially uniform distribution in the formulation, e.g. about 40 mesh.

Some examples of suitable excipients include lactose, dextrose, sucrose, sorbitol, mannitol, starches, gum acacia, calcium phosphate, alginates, tragacanth, gelatin,
10 calcium silicate, microcrystalline cellulose, polyvinylpyrrolidone, cellulose, water, syrup, and methyl cellulose. The formulations can additionally include: lubricating agents such as talc, magnesium stearate, and mineral oil; wetting agents; emulsifying and suspending
15 agents; preserving agents such as methyl- and propylhydroxybenzoates; sweetening agents; and flavoring agents. The compositions of the invention can be formulated so as to provide quick, sustained or delayed release of the active ingredient after administration to
20 the patient by employing procedures known in the art.

The compositions are preferably formulated in a unit dosage form, each dosage containing from about 0.001 to about 100 mg, more usually about 1.0 to about 30 mg, of the active ingredient. The term "unit dosage form" refers to
25 physically discrete units suitable as unitary dosages for human subjects and other mammals, each unit containing a predetermined quantity of active material calculated to produce the desired therapeutic effect, in association with a suitable pharmaceutical excipient.

The active compounds are generally effective over a wide dosage range. For examples, dosages per day normally fall within the range of about 0.0001 to about 30 mg/kg of body weight. In the treatment of adult humans, the range of about 0.1 to about 15 mg/kg/day, in single or divided
30 dose, is especially preferred. However, it will be understood that the amount of the compound actually administered will be determined by a physician, in the
35

-157-

light of the relevant circumstances, including the condition to be treated, the chosen route of administration, the actual compound or compounds administered, the age, weight, and response of the individual patient, and the severity of the patient's symptoms, and therefore the above dosage ranges are not intended to limit the scope of the invention in any way. In some instances dosage levels below the lower limit of the aforesaid range may be more than adequate, while in other cases still larger doses may be employed without causing any harmful side effect, provided that such larger doses are first divided into several smaller doses for administration throughout the day.

Formulation Example 1

Hard gelatin capsules containing the following ingredients are prepared:

<u>Ingredient</u>	<u>Quantity</u> <u>(mg/capsule)</u>
Compound of Example 30	30.0
Starch	305.0
Magnesium stearate	5.0

The above ingredients are mixed and filled into hard gelatin capsules in 340 mg quantities.

-158-

Formulation Example 2

A tablet formula is prepared using the ingredients below:

5	<u>Ingredient</u>	<u>Quantity (mg/tablet)</u>
	Compound of Example 129	25.0
10	Cellulose, microcrystalline	200.0
	Colloidal silicon dioxide	10.0
15	Stearic acid	5.0

The components are blended and compressed to form tablets, each weighing 240 mg.

Formulation Example 3

20 A dry powder inhaler formulation is prepared containing the following components:

	<u>Ingredient</u>	<u>Weight %</u>
25	Compound of Example 142	5
	Lactose	95

30 The active mixture is mixed with the lactose and the mixture is added to a dry powder inhaling appliance.

Formulation Example 4

Tablets, each containing 30 mg of active ingredient, are prepared as follows:

35

-159-

	<u>Ingredient</u>	<u>Quantity (mg/tablet)</u>
5	Compound of Example 41	30.0 mg
	Starch	45.0 mg
	Microcrystalline cellulose	35.0 mg
10	Polyvinylpyrrolidone (as 10% solution in water)	4.0 mg
	Sodium carboxymethyl starch	4.5 mg
15	Magnesium stearate	0.5 mg
	Talc	<u>1.0 mg</u>
20	Total	120 mg

The active ingredient, starch and cellulose are passed through a No. 20 mesh U.S. sieve and mixed thoroughly. The solution of polyvinylpyrrolidone is mixed with the resultant powders, which are then passed through a 16 mesh U.S. sieve. The granules so produced are dried at 50-60°C and passed through a 16 mesh U.S. sieve. The sodium carboxymethyl starch, magnesium stearate, and talc, previously passed through a No. 30 mesh U.S. sieve, are then added to the granules which, after mixing, are compressed on a tablet machine to yield tablets each weighing 120 mg.

Formulation Example 5

Capsules, each containing 40 mg of medicament are made as follows:

	<u>Ingredient</u>	<u>Quantity (mg/capsule)</u>
40	Compound of Example 51	40.0 mg
	Starch	109.0 mg
	Magnesium stearate	<u>1.0 mg</u>
45	Total	150.0 mg

-160-

The active ingredient, cellulose, starch, and magnesium stearate are blended, passed through a No. 20 mesh U.S. sieve, and filled into hard gelatin capsules in 150 mg quantities.

Formulation Example 6

Suppositories, each containing 25 mg of active ingredient are made as follows:

<u>Ingredient</u>	<u>Amount</u>
Compound of Example 98	25 mg
Saturated fatty acid glycerides to	2,000 mg

The active ingredient is passed through a No. 60 mesh U.S. sieve and suspended in the saturated fatty acid glycerides previously melted using the minimum heat necessary. The mixture is then poured into a suppository mold of nominal 2.0 g capacity and allowed to cool.

Formulation Example 7

Suspensions, each containing 50 mg of medicament per 5.0 ml dose are made as follows:

<u>Ingredient</u>	<u>Amount</u>
Compound of Example 99	50.0 mg
Xanthan gum	4.0 mg
Sodium carboxymethyl cellulose (11%) Microcrystalline cellulose (89%)	50.0 mg
Sucrose	1.75 g
Sodium benzoate	10.0 mg
Flavor and Color	q.v.
Purified water to	5.0 ml

-161-

5 The medicament, sucrose and xanthan gum are blended, passed through a No. 10 mesh U.S. sieve, and then mixed with a previously made solution of the microcrystalline cellulose and sodium carboxymethyl cellulose in water. The sodium benzoate, flavor, and color are diluted with some of the water and added with stirring. Sufficient water is then added to produce the required volume.

Formulation Example 8

10 Capsules, each containing 15 mg of medicament, are made as follows:

	<u>Ingredient</u>	<u>Quantity</u> <u>(mg/capsule)</u>
15	Compound of Example 105	15.0 mg
	Starch	407.0 mg
20	Magnesium stearate	<u>3.0 mg</u>
	Total	425.0 mg

25 The active ingredient, cellulose, starch, and magnesium stearate are blended, passed through a No. 20 mesh U.S. sieve, and filled into hard gelatin capsules in 425 mg quantities.

Formulation Example 9

30 An intravenous formulation may be prepared as follows:

	<u>Ingredient</u>	<u>Quantity</u>
35	Compound of Example 106	250.0 mg
	Isotonic saline	1000 ml

Formulation Example 10

A topical formulation may be prepared as follows:

-162-

	<u>Ingredient</u>	<u>Quantity</u>
5	Compound of Example 118	1-10 g
	Emulsifying Wax	30 g
	Liquid Paraffin	20 g
10	White Soft Paraffin	to 100 g

The white soft paraffin is heated until molten. The liquid paraffin and emulsifying wax are incorporated and stirred until dissolved. The active ingredient is added and stirring is continued until dispersed. The mixture is then cooled until solid.

Formulation Example 11

Sublingual or buccal tablets, each containing 10 mg of active ingredient, may be prepared as follows:

	<u>Ingredient</u>	<u>Quantity Per Tablet</u>
25	Compound of Example 88	10.0 mg
	Glycerol	210.5 mg
	Water	143.0 mg
30	Sodium Citrate	4.5 mg
	Polyvinyl Alcohol	26.5 mg
35	Polyvinylpyrrolidone	<u>15.5 mg</u>
	Total	410.0 mg

The glycerol, water, sodium citrate, polyvinyl alcohol, and polyvinylpyrrolidone are admixed together by continuous stirring and maintaining the temperature at about 90°C. When the polymers have gone into solution, the solution is cooled to about 50-55°C and the medicament is slowly admixed. The homogenous mixture is poured into forms made of an inert material to produce a drug-containing diffusion matrix having a thickness of about 2-4 mm. This diffusion

-163-

matrix is then cut to form individual tablets having the appropriate size.

Another preferred formulation employed in the methods of the present invention employs transdermal delivery devices ("patches"). Such transdermal patches may be used to provide continuous or discontinuous infusion of the compounds of the present invention in controlled amounts. The construction and use of transdermal patches for the delivery of pharmaceutical agents is well known in the art. See, e.g., U.S. Patent 5,023,252, issued June 11, 1991, herein incorporated by reference. Such patches may be constructed for continuous, pulsatile, or on demand delivery of pharmaceutical agents.

Frequently, it will be desirable or necessary to introduce the pharmaceutical composition to the brain, either directly or indirectly. Direct techniques usually involve placement of a drug delivery catheter into the host's ventricular system to bypass the blood-brain barrier. One such implantable delivery system, used for the transport of biological factors to specific anatomical regions of the body, is described in U.S. Patent 5,011,472, issued April 30, 1991, which is herein incorporated by reference.

Indirect techniques, which are generally preferred, usually involve formulating the compositions to provide for drug latentiation by the conversion of hydrophilic drugs into lipid-soluble drugs or prodrugs. Latentiation is generally achieved through blocking of the hydroxy, carbonyl, sulfate, and primary amine groups present on the drug to render the drug more lipid soluble and amenable to transportation across the blood-brain barrier. Alternatively, the delivery of hydrophilic drugs may be enhanced by intra-arterial infusion of hypertonic solutions which can transiently open the blood-brain barrier.

The type of formulation employed for the administration of the compounds employed in the methods of the present invention may be dictated by the particular

-164-

compounds employed, the type of pharmacokinetic profile desired from the route of administration and the compound(s), and the state of the patient.

-165-

We claim:

1. A compound of Formula I:

in which

A-B is -CH-CH₂- or -C=CH-;

R is H or C₁-C₆ alkyl;

R¹ is H or C₁-C₄ alkyl;

X is -S-R², -C(O)R³, -C(O)NR⁴R¹⁵, -NR⁵R⁶, -NR⁷SO₂R⁸,
-NHC(Q)NR¹⁰R¹¹, -NHC(O)OR¹² or -NR¹³C(O)R¹⁴;

where

Q is O, or S;

R² is phenyl, substituted phenyl, phenyl(C₁-C₄ alkylene), phenyl(C₁-C₄ alkylene) substituted in the phenyl ring, or pyridinyl;

R³ is C₁-C₆ alkyl, phenyl(C₁-C₄ alkylene), phenyl(C₁-C₄ alkylene) substituted in the phenyl ring, naphthyl, N-methyl-N-methoxyamino, heteroaryl, substituted heteroaryl, heteroaryl(C₁-C₄ alkyl), or substituted heteroaryl(C₁-C₄ alkyl);

R⁴ is heteroaryl, substituted heteroaryl, heteroaryl(C₁-C₄ alkyl), or substituted heteroaryl(C₁-C₄ alkyl);

R⁴ and R¹⁵ taken together with the nitrogen atom form a pyrrolidine, piperidine, substituted piperidine, piperazine, 4-substituted piperazine, morpholine or thiomorpholine ring;

R⁵ and R⁶ are both trifluoromethanesulfonyl;

-166-

R⁷ is H or C₁-C₄ alkyl;

R⁸ is C₁-C₄ alkyl, phenyl, substituted phenyl, or di(C₁-C₄ alkyl)amino;

5 R¹⁰ and R¹¹ are independently selected from the group consisting of C₁-C₆ alkyl, C₃-C₆ alkenyl, C₃-C₈ cycloalkyl, phenyl, substituted phenyl, phenyl(C₁-C₄ alkylene), phenyl(C₁-C₄ alkylene) substituted in the phenyl ring, ((C₁-C₄ alkyl or C₁-C₄ alkoxy carbonyl substituted)C₁-C₄ alkyl)phenyl, C₁-C₄ alkyl α -substituted with C₁-C₄ alkoxy carbonyl; or

10 R¹⁰ and R¹¹ taken together with the nitrogen atom form a pyrrolidine, piperidine, piperazine, 4-substituted piperazine, morpholine or thiomorpholine ring;

15 R¹² is C₁-C₆ alkyl, C₃-C₆ alkenyl, phenyl, substituted phenyl, C₃-C₈ cycloalkyl, C₁-C₄ alkyl ω -substituted with C₁-C₄ alkoxy;

R¹³ is H or C₁-C₄ alkyl;

20 R¹⁴ is C₁-C₁₀ alkyl substituted with up to three substituents selected from the group consisting of hydroxy, C₁-C₄ alkoxy, halo, aryloxy, C₁-C₄ alkoxy carbonyl and heteroaryloxy, C₂-C₁₀ alkenyl, C₂-C₁₀ alkynyl, C₃-C₈ cycloalkyl, phenyl, substituted phenyl, naphthyl, phenyl(C₁-C₄ alkylene), phenyl(C₁-C₄ alkylene) substituted on the phenyl ring, 2-phenylethylen-1-yl, diphenylmethyl, benzofused C₄-C₈ cycloalkyl, C₁-C₄ alkylene ω -substituted with C₃-C₆ cycloalkyl, or a heterocycle;

25 R¹⁵ is H or C₁-C₆ alkyl;

30 subject to the proviso that when R⁷ is H, R⁸ is not C₁-C₄ alkyl; and pharmaceutically acceptable acid addition salts and solvates thereof.

2. A compound of Claim 1, in which A-B is -C=CH-.

3. A compound of Claim 1, in which A-B is -CH-CH₂-.

4. A compound of Claim 1, in which R¹ is H.

35 5. A pharmaceutical formulation which comprises, in association with a pharmaceutically acceptable carrier, diluent or excipient, a compound of Claim 1.

-167-

6. A pharmaceutical formulation of Claim 5, in which A-B is -C=CH-.

7. A pharmaceutical formulation of Claim 5, in which A-B is -CH-CH₂-.

5 8. A pharmaceutical formulation of Claim 5, in which R is H.

9. A method for the activation of 5-HT_{1F} receptors in mammals, comprising administering to a mammal in need of such activation an effective amount of a compound of Claim 1.

10

10. A method of Claim 9 where the mammal is a human.

11. A method for the inhibition of neuronal protein extravasation, comprising administering to a mammal in need thereof an effective amount of a compound of Claim 1.

15 12. A method of Claim 11 where the mammal is a human.

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:
2. ☐ Claims Nos.:
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

Please See Extra Sheet.

1. ☒ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
☐ No protest accompanied the payment of additional search fees.

BOX II. OBSERVATIONS WHERE UNITY OF INVENTION WAS LACKING

This ISA found multiple inventions as follows:

This application contains the following inventions or groups of inventions which are not so linked as to form a single inventive concept under PCT Rule 13.1. In order for all inventions to be examined, the appropriate additional examination fees must be paid.

Group I, claims 1-10, drawn to compounds, compositions and method of activation of 5HT1F receptors.

Group II, claims 11-12, drawn to method of inhibition of neuronal protein extravasation.

The inventions listed as Groups I and II do not relate to a single inventive concept under PCT Rule 13.1 because, under PCT Rule 13.2, they lack the same or corresponding special technical features for the following reasons: at least two process of use inventions are found. The inhibition of neuronal protein extravasation is a multiple etiological process and is independent of a biological process of inhibition of 5HT1F receptors.
